

Migration Assistant

Export

1. **Old Computer** - should be the workstation being replaced,
2. **Suggested Data to Include...**
 - AppData,
 - Printers,
 - My Documents,
 - WallPapers,
 - Favorites,
 - My Pictures,
 - Desktop
3. **Save State Definition** - Browse to the directory intended; *example E:\Storage*.
4. **Profile Selection** - Preferred migration is all profiles logged in during the prior 90 days,
Action *select the checkbox
5. **Export all captured Data with Encrypt On!**
Action *select the checkbox
6. All other features of the export are optional.

- The workstation architecture will be automatically queried and assigned so that the binary files are appropriately used,
- The selection of custom xml files has been disabled in this version because the use of certain xml files at the same time causes duplication of import files.
 - This is a mitigating security disable and it's entirely possible future versions of the Migration Assistant will provide this feature.<https://docs.microsoft.com/en-us/windows/deployment/usmt/usmt-best-practices>
- Close all open applications before running the Migration Assistant
 - While volume shadow copies (/vsc) are active and can work around the locked files, *most times*, it is best practice to ensure the migration by closing applications prior.
- TM encrypted files (EFS) are also ignored and logged in version 1.4.1.
 - The files that are flagged as Team Member encrypted are logged with the rest of the logs and emailed according to the Email Settings tab.

After running the import, you must log off for some settings, such as fonts and general registry settings to take effect.
