

# Migration Assistant

## Encryption

Encryption is required for migration during the export and import process.

- Beginning with Version 1.5
  - Encryption use is verified before the migration is permitted to progress,
  - If the intended data is not encrypted then the migration is halted and the above alert is displayed to the user,
    - At this point all that is required is the user click the checkbox that says "Encrypt captured Data" and then click the Export button again.
    - The continued results above are the migration after correction.
  - This check is done for both exports and imports...

**After running the import, you must log off for some settings, such as fonts and general registry settings to take effect.**
